

Free Your Tool Monitoring With
eltimon

eltimon[®] existing platform since 2015 for partners and customers

- **Preventive Maintenance**
- **Management Desk**
- **Augmented Operator**
- **Sensors**

Solutions for digitalisation have to be integrated into a network. The interfaces seem to be the challenge.

One level of IOT is the factory with all its communicating elements. There we have process optimisation, real time data, big data and digital mirror. These tasks are handled by universities and larger global companies.

Another task concerns preventive maintenance, process reliability and unpredictable production stopps. Components in production, which could not be monitored because of missing sensors seem to be most critical.

This is the area for **eltimon**. **eltimon** is the open platform for partners and customers. **eltimon** offers all the elements for a total digitalisation without any problems regarding interfaces.

eltimon sensors and modules for communication are available for partners to be integrated into technical/mechanical hardware. More **eltimon** elements: **eltimon** reader, software for visualisation, **eltimon** cloud and the Management Desk. **eltimon** is the total solution for preventive maintenance with many integrated services.

eltimon cloud:

Customers are enabled to monitor their components in production of different manufacturers through one tool with comparable results. Manufacturers and suppliers will find synergies. Multiple source purchasing.

Management Desk:

One screen: all components in production with their actual status. For example: machines, robots, live tools etc. Relevant status information will be found, such as "automatic mode", "manual mode", "under Maintenance", "interruption", "yield" etc..

Long lasting, functionality and rigidity

It is our goal to design and supply live tools with convincing features.
This example: mimatic multi spindlehead with eltimon N1.0. Two years heavy duty usage with almost non stop operation. All mechanical and electronical parts are in good condition. Due to eltimon a perfect timing for maintenance.

Maintenance at the right time saves money. All workpieces are manufactured with the same high quality. No rejects.

catch **back** **eltimon**[®] catch back - the story

Totally independent **eltimon** B2.0 Systems could be compared with a satellite on its way to very far away planets. These satellites are intelligent, do have an energy source, sensors and a communication device. The journey is very long and the satellite is set into deep sleep mode for certain periods of time in order to save energy. But there are circumstances where the control center on earth needs to interact at an unplanned point of time. The experts in the control center are very happy if they have caught back the control over their satellite!

eltimon B2.0 is calling as well in predefined periods. **eltimon** catch back is the solution for operators or for the tool management to ask **eltimon** at any point of time for information. Previously the live tool was not accessible for data. Spontaneous data demand - despite deep sleep - will be possible with **eltimon** catch back for live tools with Bluetooth. Communication for 5 years is possible without battery change. The control of the live tool is given back to the operator by **eltimon** catch back. The operator could even change parameters of the data collection systems.

Bluetooth (Bluetooth**L**ow**E**nergie) – challenges & solutions for industrial applications

Bluetooth – technologies have been developed for consumers and initially not for the industry. BLE is the latest development for the Internet of Things. Conventional batteries shall last months instead of days. In live tools we have less space and smaller batteries shall last for years. This requires an innovation like **eltimon** catch back. The **eltimon** catch back technology is available for all partners of the open **eltimon** platform. Bluetooth receivers accept signals from various devices at the same time. For the live tool application we will find the following scenario: Our receiver is showing live tools in different locations as machine, shelf, and so forth.

If one of the live tools goes to red, it has to be sent for maintenance! Theoretically there is the possibility to have a central registration for the location of each tool. The location on the turret could be found in the control system of the machine. The **eltimon** reader features a simple and reliable identification of the live tools.

eltimon offers additionally an automatic system for locating. The identification code for the stock location (turret or shelf) will be automatically collected by **eltimon** catch back. **eltimon** will be always updated by the information of its location! This will help to reduce the set up time of the machine.

Features:

Identification Live Tool with eltimon B 2.0

<i>Live Tool 1</i>	<i>Live Tool 2</i>	<i>Live Tool 3</i>	<i>Live Tool 4</i>	<i>Live Tool 5</i>	<i>Live Tool 6</i>
Mori Seiki BMT 40	Mori Seiki BMT 40	Doosan BMT 45	Mori Seiki BMT 40	Mori Seiki BMT 40	Mori Seiki BMT 40
					

Features:

Transmission interval Bluetooth (BluetoothLowEnergie)

Features:

Smaller size by Bluetooth

Features:

Size Live Tool N1.0 feat. Live Tool B2.0

The space-saving technology of the Bluetooth module allows a small size.

eltimon N 1.0 - proven system since 2015

The functionality of **eltimon** N 1.0 is similar to RFID-systems for door locks or at accesspoints for ski lifts. There is no electromagnetic radiation in the environment. In comparison to the well known systems, **eltimon** has an inbuild intelligence.

Management Desk – cloud.eltimon.de

Example for the AMB Smart Factory 2018

A clear overview of the producing elements in the factory. Status information important to the management.
One more mouse click leads to detailed deeper information.
